

ABSTRACT

A document capture arm connected to an imaging device and positionable over a platen for retaining a document on the platen for imaging.

- 5 The document capture arm holds one or more documents against the platen in a selected position or arrangement. The document capture arm may be configured as an arm that may insert into a receiver. The document capture arm may be easily installed for use and may be easily removed for storage when not needed. Alternately, the document capture arm may include an actuator that is attached to
- 10 and extends from the arm, projecting beyond the axis of rotation of the platen cover at the hinge. When the platen cover is lifted to an open position, the capture arm actuator is acted upon by the platen cover, lifting the document capture arm to an open position.
